

The image displays a 20x20 grid of colored squares, representing a complex pattern. The colors used are red, orange, and yellow. The pattern is characterized by several distinct features:

- Red Cells:** These are concentrated in the upper-left and upper-right quadrants, forming a large, irregular shape. A horizontal band of red cells runs across the middle of the grid, and a vertical column of red cells is located on the left side.
- Orange Cells:** These are scattered throughout the grid, often forming a border around the red cells or filling in the spaces between them.
- Yellow Cells:** These are the most numerous and are distributed across the entire grid, often forming the background or filling in the spaces between the other colors.

The overall pattern is highly irregular and complex, with many small clusters and lines of different colors. The grid is composed of 400 individual cells, each colored independently.
